## Problem Set #7

Reading: Rohlf Chapter 6 Useful integrals:

$$\int_{-\infty}^{\infty} e^{-(ax^2 + bx)} = \sqrt{\frac{\pi}{a}} e^{b^2/4a} \quad a > 0$$
$$\int_{-\infty}^{\infty} x^2 \cdot e^{-(x/a)^2} = \frac{a^3}{2}\sqrt{\pi} \quad a > 0$$

### Problem 1:

In class, we stated that  $\Delta x \cdot \Delta p_x = \hbar/2$  for a Gaussian wave function by hand-waving. In this question you will show this quantitatively. Consider the wave function  $\psi(x) = Ce^{-\frac{1}{2}(x/\sigma)^2}$  for a particle:

- a) Find C such that the probability distribution is properly normalized,
- b) Find g(k),
- c) Find the average position of the particle,  $\langle x \rangle = \int dP \cdot x$ , where P is the probability function obeying  $dP/dx = |\psi(x)|^2$
- d) Find the average  $x^2$ ;  $\langle x^2 \rangle = \int dP \cdot x^2$ ,
- e) Find  $\Delta x$ ;  $(\Delta x)^2 = \int P \cdot (x \langle x \rangle)^2$ , (Hint: you do not to evaluate this integral; you can use the results found in previous parts.)
- f) Using the symmetry between  $\psi(x)$  and g(k) functions, write down  $\Delta p_x$  without evaluating any integral,
- g) Show that  $\Delta x \cdot \Delta p_x = \hbar/2$ .

### Problem 2: – Rohlf 5.22 – Modified

Even a professional musician with "perfect pitch" will have trouble identifying the pitch of a note if the duration is too short. Why? State your reasoning clearly, draw sketch of the waves if needed.

### Problem 3:

If a particle can exist either at x = -L or at x = L with equal probability, what is  $\Delta x$ ?

### Problem 4: – Rohlf 5.20 – Modified

Consider an electron and a proton each confined to a volume of  $10^{-30}$  m<sup>3</sup>. Which particle has a larger minimum kinetic energy? Why? State your reasoning clearly.
